Downloaded Data - Monday, January 08, 2018.log
WaterGen Data 010818.xlsx

As you can see, John is trying to verify these numbers. As the weather moderates next week (with a chance of rain), both dewpoint and temperature of the outside air will increase. In addition, the amount of heating (and associated decrease in relative humidity) will be reduced.

Has Avi been able to complete the foreign visitor form?

These values are taken inside the building. We will try to verify.

Hi Oren & Avi:

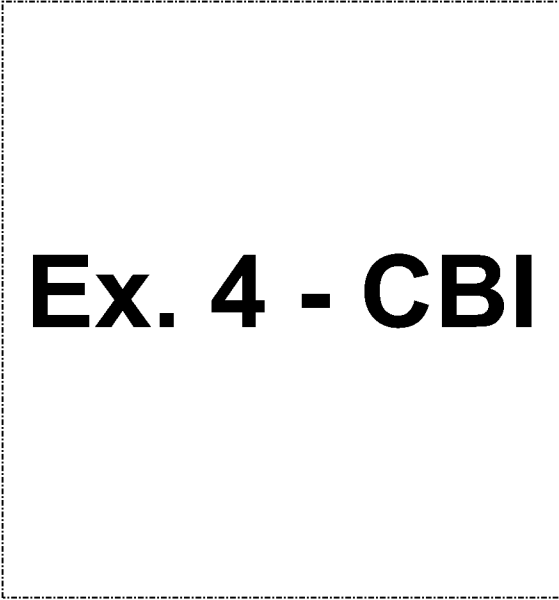

Attached are the temperature and humidity data from the Dickson logger. I left one file as a

DicksonWare .log file that the DicksonWare software should recognize. Please let me know if you can open this file with the DicksonWare and have it reproduce the graphs.

The second file was a text file that I converted to an Excel file. Currently, the temperature and humidity in Cincinnati have been very low with low relative humidity. Today, the temperature has moderated a bit all the way up to 30 deg. F. As a result the RH% is increasing slightly. Please let me know if you have any questions.
